- * Colour: black

Colours:

The singers' voice causes a quick displacement of air in some syllables which in turn causes an instantaneous clipping on the microphones' membrane.

The POP OFF® is our professional proposal for a microphone filter. It is made of a permeable nylon canvas to reduce or eliminate the "popping" and "sibilance" effect, like for example when the words "pop stars" are pronounced.

The use of POP OFF® solves this situation, not even being necessary to adjust the pre-amplifier and take therefore dynamics away from sound capturing.

This accessory has a strong flexible arm which is robustly fastened to the microphone's tripod.
