)) LEAKYFM®

COLOURS

JOCAVI has developed LeakyFM® as an additional option within the range of its absorption panels. It is mainly meant for radio and television rooms as well as broadcasting and voiceover rooms.

The typical voice-off loudness requires an appropriate planning of the room's acoustics in order to provide good sound recording. JOCAVI has come up with this product which has a good absorption coefficient at 500hz, exactly within the mid-range of the human voice, thus creating a sort of a loudness effect that radio speakers and professionals much appreciate.

LeakyFM® is a continuous surface coating product of a different aesthetics, is attractive and has a pleasant design, thus making it easier to decorate rooms. It is built with three overlapping layers of absorbent and permeable materials made from natural fibres and recycled synthetic fibres. Besides its two standard sizes, this product may also be manufactured in other sizes according to the requirements of each project.
